Personalized Medicine

- Medicine is personal:
  - We are all different.
  - Some of our differences translate into how we react to drugs as individuals.
  - This is why personalized medicine is important to everyone.
- Why does someone need twice the standard dose to be effective?
- Why does this drug work for you but not me?
- Why do I have side-effects and you don't?
- Why do some people get cancer and others don't?
- Why is anecdotal information irrelevant to your own health and treatment?

Is Medicine a Science or an Art?

If it were not for the great variability among individuals, medicine might well be a science, not an art.

- Sir William Osler, Physician 1892
- Johns Hopkins School of Medicine
- Johns Hopkins Hospital
- Father of modern medicine

The Goal of Personalized Medicine
by Felix Frueh

- The Right Dose of
- The Right Drug for
- The Right Indication for
- The Right Patient at
- The Right Time.

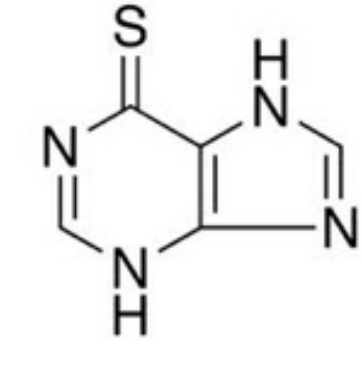
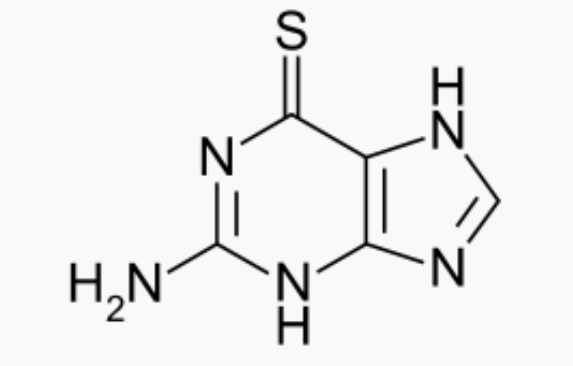
Purine Analogs: A Case Study in Pharmacogenetics

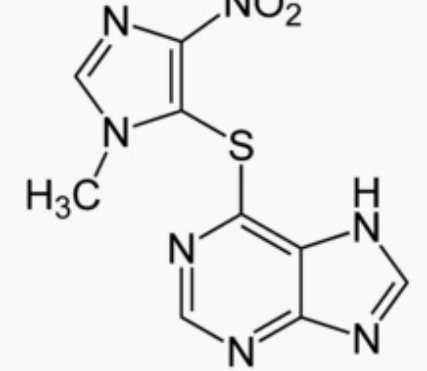
- 6-mercaptopurine, 6-thioguanine, azathioprine
- Used to treat lymphoblastic leukemia, autoimmune disease, inflammatory bowel disease, immune supression after organ transplants
- Interferes with nucleic acid synthesis
- Therapeutic index limited by myelosuppression



6-mercaptopurine

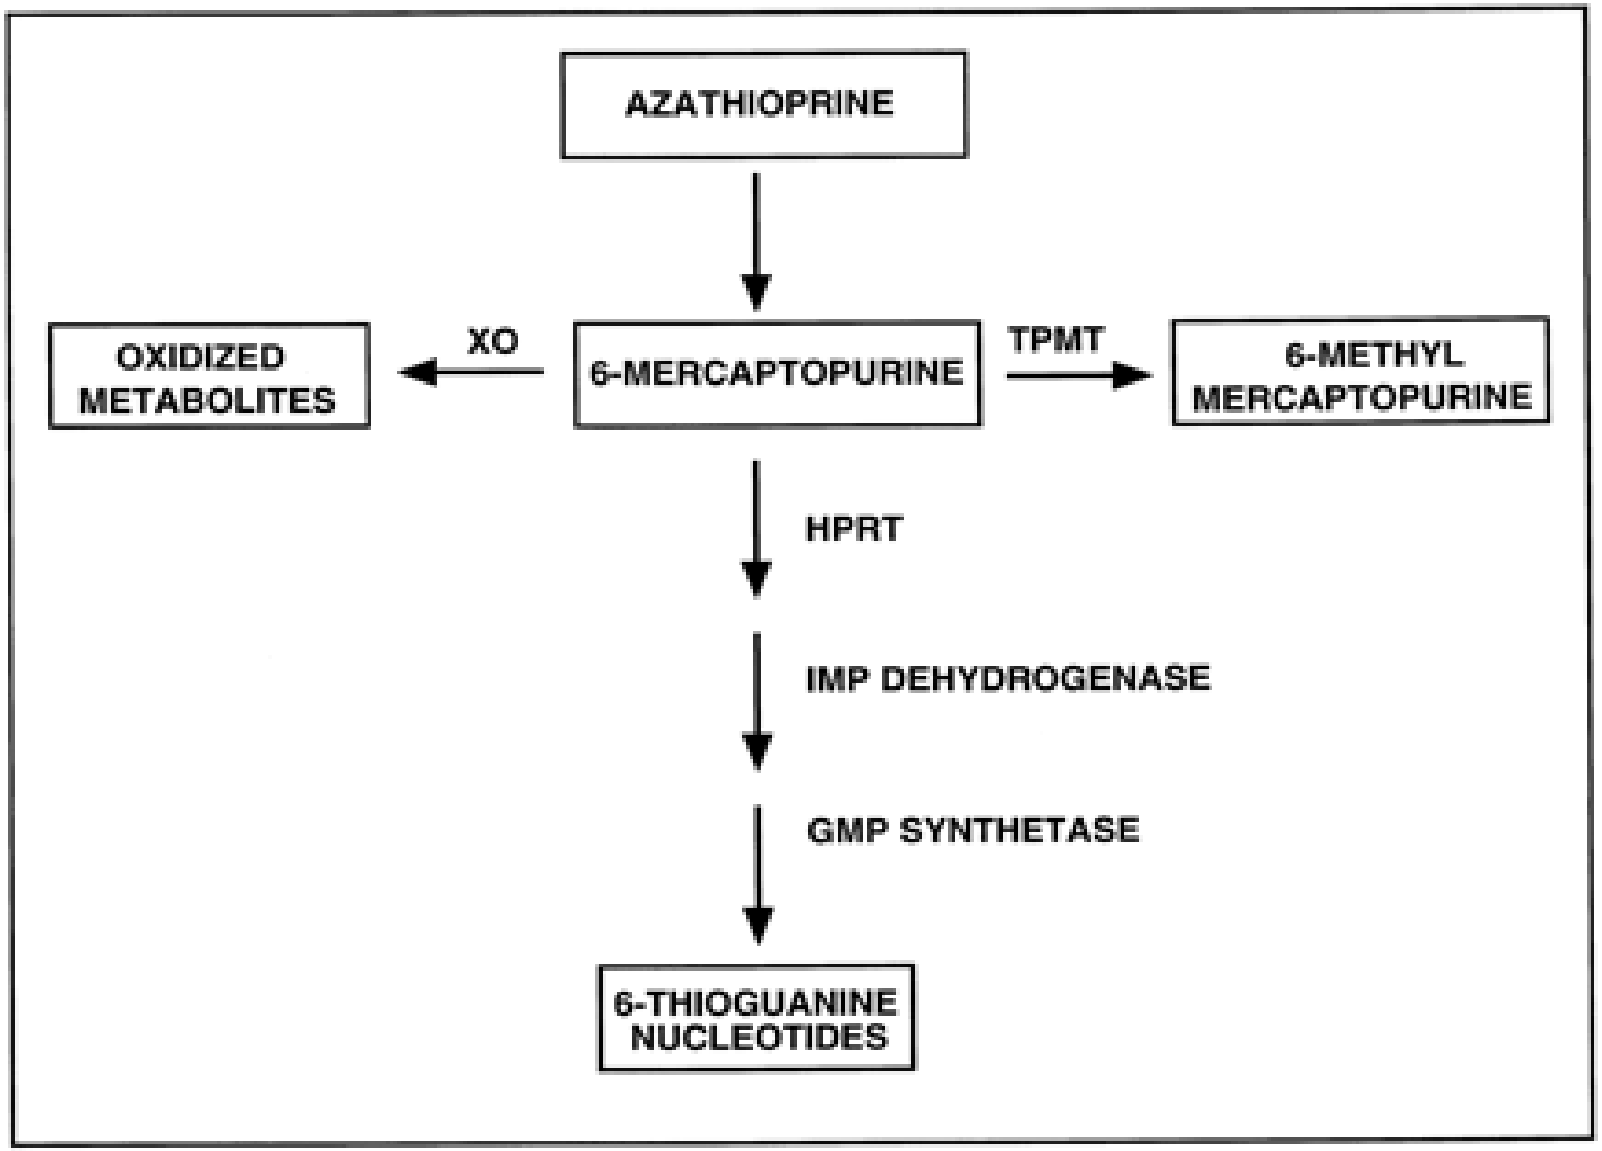


6-thioguanine



azathioprine

Metabolism of 6-MP



L Wang and R Weinshilboum, Oncogene 25, 1629-1638 (2006)

Pharmacogenetics: A Case Study

Individuals respond differently to the anti-leukemia drug 6-mercaptopurine.

Most people metabolize the drug quickly. Doses need to be high enough to treat leukemia and prevent relapses.

Others metabolize the drug slowly and need lower doses to avoid toxic side effects of the drug.

A small portion of people metabolize the drug so poorly that its effects can be fatal.

Courtesy of Michelle Whirl-Carillo

Pharmacogenetics: A Case Study

Individuals respond differently to the anti-leukemia drug 6-mercaptopurine.

Most people metabolize the drug quickly. Doses need to be high enough to treat leukemia and prevent relapses.

Others metabolize the drug slowly and need lower doses to avoid toxic side effects of the drug.

A small portion of people metabolize the drug so poorly that its effects can be fatal.

The diversity in responses is due to variations in the gene for an enzyme called TPMT, or thiopurine methyltransferase.

Human Cytochrome Oxidase P450 Enzymes

http://en.wikipedia.org/wiki/Cytochrome_P450#P450s_in_humans

- 57 Different active genes
- 18 Different families
- 43 subfamilies
- CYP1, CYP2 and CYP3 are primarily involved in drug metabolism.
- CYP2A6, CYP2B6, CYP2C9 ,CYP2C19, CYP2D6, CYP2E1 and CYP3A4 are responsible for metabolizing most clinically important drugs

Human UDP Glucosyltransferases

http://en.wikipedia.org/wiki/Glucuronosyltransferase

- 3 Families
- 22 Different alleles
  - B3GAT1, B3GAT2, B3GAT3
  - UGT1A1, UGT1A3, UGT1A4, UGT1A5, UGT1A6, UGT1A7, UGT1A8, UGT1A9, UGT1A10
  - UGT2A1, UGT2A2, UGT2A3, UGT2B4, UGT2B7, UGT2B10, UGT2B11, UGT2B15, UGT2B17, UGT2B28

Human Glutathione S Transferases

http://en.wikipedia.org/wiki/Glutathione_S-transferase

GST Class	*Homo sapiens* GST Class Members (22)
Alpha	GSTA1, GSTA2, GSTA3, GSTA4, GSTA5
Delta	
Kappa	GSTK1
Mu	GSTM1, GSTM1L (RNAi), GSTM2, GSTM3, GSTM4, GSTM5
Omega	GSTO1, GSTO2
Pi	GSTP1
Theta	GSTT1, GSTT2, GSTT4
Zeta	GSTZ1 (aka GSTZ1 MAAI-Maleylacetoacetate isomerase)
Microsomal	MGST1, MGST2, MGST3

Polymorphic Cytochrome P-450s

CYP2B6

Selected Substrates	Location	Poor Metabolizer Incidence
bupropion cyclophosphamide efavirenz methadone ifosfamide	Chromosome 19	3-4% of Caucasians

CYP2C9

Selected Substrates	Location	Poor Metabolizer Incidence
NSAIDs celecoxib diclofenac ibuprofen naproxen piroxicam Oral Hypoglycemic Agents tolbutamide glipizide ARBs irbesartan losartan fluvastatin warfarin phenytoin	Chromosome 10	1-3% Caucasians

CYP2C19

Selected Substrates	Location	Poor Metabolizer Incidence
Proton pump (-) amitriptyline cyclophosphamide diazepam indomethacin phenytoin phenobarbital progesterone voriconazole	Chromosome 10	2-4% African-Americans 3-5% Caucasians 15-20% Asians

CYP2D6

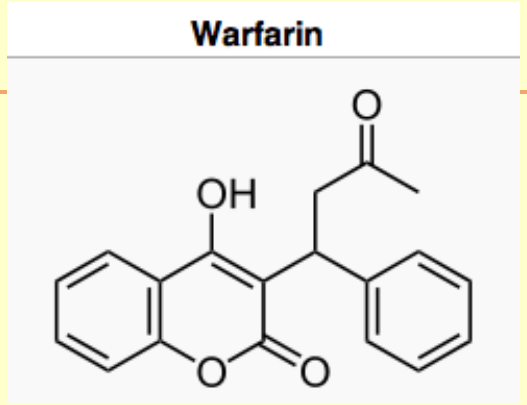
Selected Substrates	Location	Poor Metabolizer Incidence
antidepressants beta-blockers antipsychotics chlorpheniramine codeine dextromethorphan ondansetron lidocaine promethazine tamoxifen tramadol	Chromosome 22	5-10% Caucasians

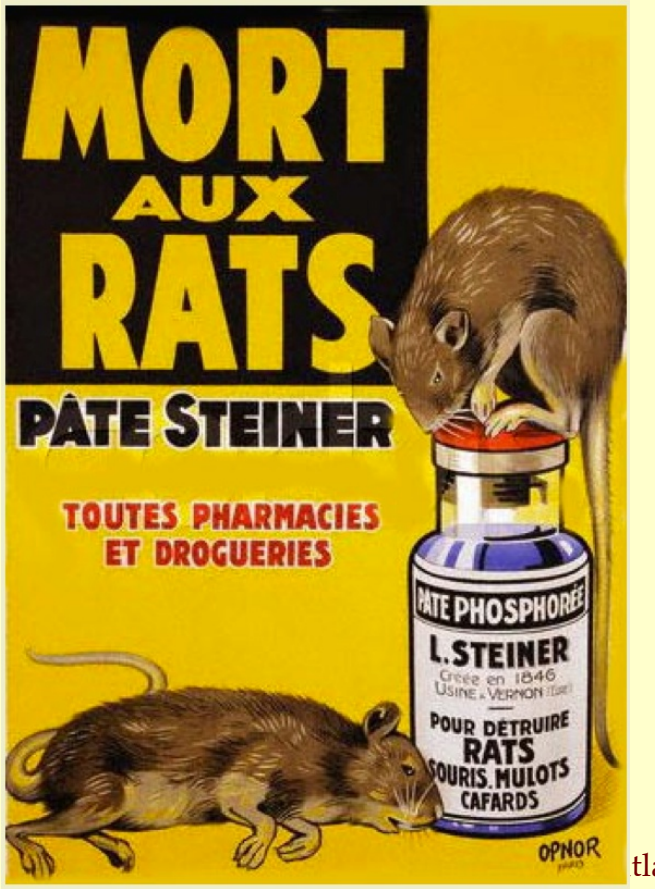
Effect of Metabolic Rate on Drug Dosage

Drug	Poor Metabolizer Phenotype
Prodrug, needs metabolism to work (eg. codeine is metabolized by CYP 2D6 to morphine)	Poor efficacy Possible accumulation of prodrug
Active drug, inactivated by metabolism (example is omeprazole)	Good efficacy Accumulation of active drug can produce adverse reactions May need lower dose

Drug	Ultra-rapid Metabolizer Phenotype
Prodrug, needs metabolism to work (eg. codeine is metabolized by CYP 2D6 to morphine)	Good efficacy, rapid effect
Active drug, inactivated by metabolism (example is omeprazole)	Poor efficacy Need greater dose or slow release formulation

Warfarin: Significant Problems for Rats!





Warfarin: Significant Problems for Humans!

- Ranks #1 in total mentions of deaths for drugs causing adverse events (from death certificates)
- Ranks among the top drugs associated hospital emergency room visits for bleeding
- Overall frequency of major bleeding range from 2% to 16% (versus 0.1% for most drugs)
- Minor bleeding event rates in randomized control trials of new anticoagulants has been as high as 29% per year.

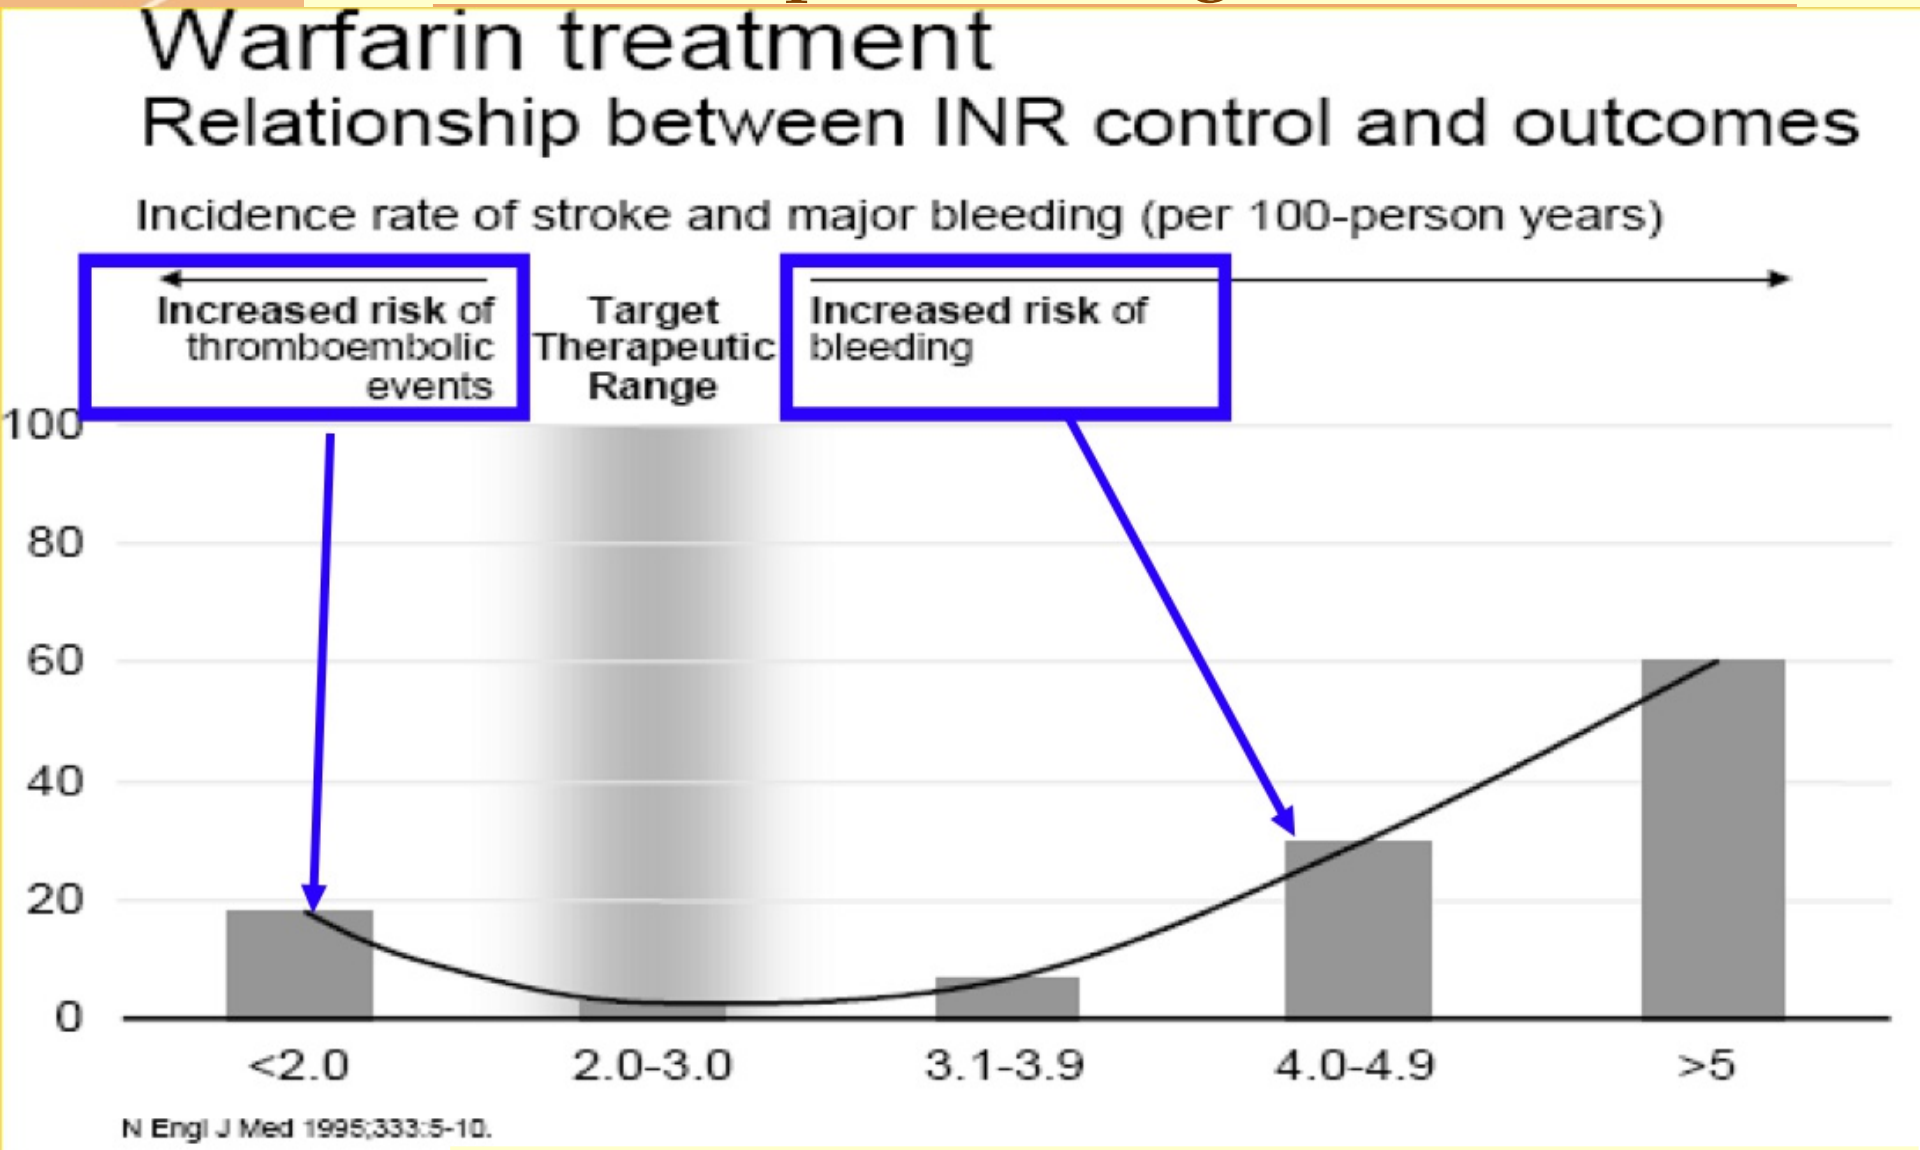
Warfarin: Significant Problems for Humans!

- Case Report July 2, 2008
  - Company director dies of brain hemorrhage after heading a football
  - Consultant neurosurgeon told the inquest the warfarin effect was probably the cause of the death
  - It can happen to anyone!

- Other Warfarin "Patients"
  - Dwight D. Eisenhower
  - Joseph Stalin

Dedicated: David Belk, who died of a brain haemorrhage brought on in a game of football, loved playing sports

Why Maintaining Warfarin Therapeutic Range is Critical



European Atrial Fibrillation Trial Study Group, N Engl J Med 1995;333:5-10.

Genetic Analysis Permits

- More rapid determination of stable therapeutic dose.
- Better prediction of dose than clinical methods alone.
- Applicable to the 70-75% of patients not in controled anticoagulation centers.
- Reduces between 4,500 and 22,000 serious bleeding events annually.
- Genetic testing now recommended by FDA

Postoperative Nausea and Vomiting (PONV)	★★	Higher Odds
Response to Interferon Beta Therapy	★★	Increased Odds of Responding
Statin Response	★★	See Report

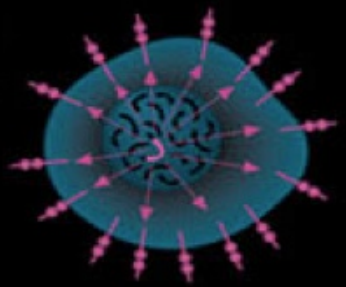
23andMe Drug Response Reports

What are Targeted Drugs?

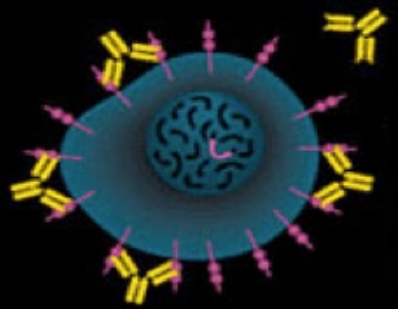
- Often, drugs are only effective in specific "sub-populations" (responders).
- Early identification of responders can have a dramatic effect of treatment success.
- Treatment of non-responders puts these individuals at unnecessary risk of adverse events, while providing no benefit.
- Personalized Medicine allows the identification of responders and non-responders for targeted therapies.
- This is happening today!

Trastuzumab (Herceptin®)

In a normal breast tissue cell, the Her-2 gene is expressing cell surface receptor required for normal cell growth.



In certain types of breast cancers, the Her-2 gene is over-expressing this cell surface receptor, contributing to cancerous cell growth.
This is the case in ~30% of breast cancers.



Herceptin (trastuzumab) is an antibody that blocks the cell surface receptor and thereby prevents further growth. As a result, disease progression is slowed down.

Personalized Drugs

- Herceptin (breast cancer, target: Her2/neu)
- Erbitux (colorectal cancer, target: EGFR)
- Tarceva (lung cancer, target: EGFR)
- Strattera (attention-deficit/hyperactivity disorder, Metabolism: P4502D6)
- 6-MP (leukemia, Metabolism: TPMT)
- Antivirals (i.e. resistance based on form of HIV)
- etc. and the list is growing rapidly …

Table of Pharmacogenomic Biomarkers in Drug Labels

Pharmacogenomics can play an important role in identifying responders and non-responders to medications, avoiding adverse events, and optimizing drug dose. Drug labels may contain information on genomic biomarkers and can describe:

- Drug exposure and clinical response variability
- Risk for adverse events
- Genotype-specific dosing
- Mechanisms of drug action
- Polymorphic drug target and disposition genes

The table below lists FDA-approved drugs with pharmacogenomic information in their labels. Some, but not all, of the labels include specific actions to be taken based on genetic information. Relevant sections of the label with such information are noted in the last column of the table. Biomarkers may include gene variants, functional deficiencies, expression changes, chromosomal abnormalities, and others. Microbial variants that influence sensitivity to anti-infectives are not included in the table. Please note that the table columns can be sorted.

Pharmacogenomic information can appear in different sections of the label. For more information on the relevance of information in various parts of the drug label (e.g. Indications and Usage, Dosage and Administration, Boxed Warning, etc.), please go to the relevant labeling guidance. For information on the FDA's initiative to improve prescription drug labels, visit the FDA/CDER Learn website.

Pharmacogenomic Biomarkers in Drug Labels

Drug	Therapeutic Area	Biomarker	Label Sections
Abacavir	Antivirals	HLA-B*5701	Boxed Warning, Contraindications, Warnings and Precautions, Patient Counseling Information
Ado-Trastuzumab Emtansine	Oncology	ERBB2 (HER2)	Indications and Usage, Warnings and Precautions, Adverse Reactions, Clinical Pharmacology, Clinical Studies
Aripiprazole	Psychiatry	CYP2D6	Clinical Pharmacology, Dosage and Administration
Arsenic Trioxide	Oncology	PML/RARα	Boxed Warning, Clinical Pharmacology, Indications and Usage, Warnings
